

ONE HABIT. TWO MATES. TEN SECONDS.

An accountability app for people who already train together. You commit to one habit, photograph yourself doing it, and two people from your own gym back it or call it. Miss a day and your run resets to zero. That is the entire product.

Everything below is design, not software. Nothing is built yet — that is the next step, and it is roughly a week of work. I want your read before I spend it.

WHY THIS ONE IS DIFFERENT

Every accountability app has the same hole: nobody who matters is watching.

STICKK

You name one referee and promise to be honest. No one sees the work. Nothing stops you lying to a friend by email.

FORFEIT

An algorithm judges your photo and the company keeps your money when you fail. You are accountable to a business, not a person.

CHALKLINE

Two people from the gym you actually attend look at the photo and decide. They will see you on Tuesday either way.

The bet is simple: **nobody in this category is community-native**. We are not matching strangers or routing money to a company — we are putting structure around a group of people who already show up for each other.

THE LOOP

Thirty seconds after a session, sweaty, one hand. That is the only moment the design cares about.

You open it. The run is the biggest thing on the screen, and there is one button.

Tapping it opens the camera straight away. No form, no category.

Shoot, then send. A note is optional and nobody has to touch it.

It goes to your corner. Two taps and a shutter, start to finish.

THEIR SIDE IS ONE TAP

This is the part every competitor gets wrong by putting it behind a notification and a separate screen.

Your proof appears on **their home screen**, underneath their own habit, labelled **Your call**. Photo, name, time, two buttons: **Back it** or **Call it**. One tap and it is gone from their day. There is no inbox, no badge, nothing to remember to visit — which is the whole reason I think peer verification can actually work here when it has never worked anywhere else.

Two backs and the day counts. Two calls and it does not.

THREE OUTCOMES

Waiting. Sent, and out with your corner. Your run is not at risk while it sits here.

Backed. It names them — Bert and Kaz, with their faces. Never an anonymous tick.

Broken. Twelve days gone. The screen prompts rather than scolds: start the next one now.

THE REST OF IT

Sign in. You type your email, we send a link, no password ever.

Your run. Hidden behind the number on the home screen. The only way to see history or end a commitment.

Setup. Designed, but *not* in the first build — I will put our four habits straight into the database by hand.

THE RULES

Deliberately blunt. Every one of these is a decision we can argue about.

SITUATION	WHAT HAPPENS
Clearing a proof	Two people must back it. Not a majority — two. With only one witness this is just StickK.
Killing a proof	Two people call it. Then the day does not count, and you can post again.
Nobody responds	After 36 hours it clears anyway, tagged <i>no response</i> . Punishing you for a slow mate would lose us both. But we count those tags — they are the honest measure of whether this works.
Missing a day	Run resets to zero. That is the only consequence in this version.
Rest days	Chosen up front. A day you never committed to is not a miss.

Late nights	The day rolls over at 4am, so a post at 1am still counts for the session you did.
Arguments	None in the app. Two calls is a miss — take it up at the gym.

WHAT IS DELIBERATELY MISSING

The first version I designed had all of this. It was unusable, so I cut it.

Money is the one worth flagging. It was in the original plan and it is the obvious way to give this teeth. I pulled it because it doubled the number of concepts and forced a second screen, and because testing two new ideas at once tells you nothing about either. It comes back in version two, and the database is built so it can.

WHAT FOUR WEEKS WOULD TELL US

1 Do mates actually respond?

This
is
the
whole
company.
If
the
answer
is
no,
the
idea
is
dead
and
we
will
know

inside
a
fortnight
for
the
cost
of a
week's
work.

2 Does being watched change whether you turn up?

Compared
against
how
consistent
you
were
before.

3 Do the watchers stay watching?

Nobody
measures
this
and
it is
what
kills
these
products.
Response
times
drifting
later,
week
over
week,
is
the
early
warning.

4 Does it survive week three?

The
classic
drop-
off.
If
runs
break
there
and
nobody
restarts,
a
streak
alone
is
not
enough
and
money
moves
back
up
the
list.

WHAT I NEED FROM YOU

Five things, and then I build it.

1 Are you in for four weeks?

Daily,
with
a
real
habit
you
would
otherwise
skip.
It
does

not
work
as a
demo.

2 Two more from the squad.

We
need
four
people.
With
just
us,
each
of
us
has
one
witness
and
the
two-
person
rule
collapses
—
the
thing
that
makes
this
different
stops
existing.
Four
gives
everyone
three
possible
backers
and
slack
for
holidays.

3 Is “Chalkline” the name?

The
gym
whiteboard
where
the
scores
go
up,
and
the
chalk
line
a
builder
snaps
to
mark
an
edge
you
then
hold
to.
Cheap
to
change
now,
expensive
later.
Cornerman
and
Two
Up
were
the
runners-
up.

4 Which city are we all in?

Sounds
trivial;
it

sets
when
a
day
ends,
and
streaks
are
wrong
everywhere
if I
guess.

5 What is your habit?

Has
to
be
photographable
— a
gym
floor,
a
plate
of
food,
a
rower
screen.
That
constraint
is
the
reason
the
proof
is
worth
anything.
